We preferred instead to use directly the very accurate values from 1 , where the polynomial coefficients are provided for up to tile degree 30. Once these coefficients are input, we proceed as before, calling a polynomial rootfinder and evaluating the partial fraction coefficients. The big advantage of Chebyshev methods, stressed in the work by Varga, is the ability to use large step size. In fact, when A is Hermitian, a relation of the form $l w (t) - w , , , l h A m , N w 0 - A - l r l V t 0$ holds, where $w i n , ,$ is the solution computed with an (m , r) order Chebyshev approximation, and $A m ,$ are constants converging to zero geometrically (see 3 and 1 for a list of A , , , s). Although such a technique will have its limitations for time-varying co-efficients and boundary...
